Experience

AI Innovation Intern

Crescendo AI

June 2026 – Present

San Francisco, CA

- Sole engineer on the internal AI platform. Five apps live on Cloud Run and Cloud SQL in six weeks.
- Model routing for triage: a rules pre-filter, then an LLM judge, then a frontier model only for drafts. A grounding gate blocks any output that cannot quote its evidence. Moving the judge to open-source models at equal quality cut cost per query 40%.
- Architected the sales data lake and migrated 5M records into it in a day. Gong, Salesforce, and HubSpot now feed it daily, giving sales one agent-queryable source of truth instead of six disconnected systems.
- Shipped the Cloudflare-to-GCP production migration in under a week: 12 data stores behind one compatibility interface.
- Closed a \$50k/year customer, outside the role: 20 minutes with their founder, then on site to deploy. Live in a week.

Software Engineer

Ovavision Fertility

July 2025 – July 2026

New York City, NY (Remote)

- Rebuilding the consumer app end to end in React and Next.js, through UAT cycles with clinical advisors. Moved model serving async on FastAPI, Celery, and Redis over AWS ECS/Fargate, taking p95 from 850ms to 210ms.
- Replaced the mocked model path with a two-stage ONNX pipeline on a dedicated GPU host, behind a polling job protocol whose idempotency guards stop a retry overwriting a finished result.
- Built the Stripe payment layer behind 100 backend tests: PaymentIntents, webhooks, coupons, regional pricing, rollover.

Data Engineering Intern

Rigetti Computing

June 2025 – Sep 2025

Fremont, CA

- Built the fab monitoring dashboard on Palantir Foundry over sensor, cryostat, and process-control streams: 15+ KPIs, used daily.
- Anomaly detection over 60M+ daily sensor records. Partitioning and indexing took the dashboard query from 2.1s to 0.74s.

Software Engineer Intern

European Bank for Reconstruction and Development (EBRD)

Jan 2025 – May 2025

London, United Kingdom (Remote)

- A RAG system on Azure OpenAI and Cognitive Search replaced keyword search as the default research path for 50+ analysts.
- NLP pipeline (spaCy, transformers) classifying 30k–70k articles a day at 86–93% precision into an analyst risk queue.
- Put the models behind gated evaluation and blue-green deploys on Azure ML and AKS. Releases went from days to hours.

Projects

DavisDine

iOS in SwiftUI, FastAPI and Firestore on Google App Engine

April 2026

Live on the App Store

- Built and shipped alone, zero to App Store in a week: allergen filtering and a macro planner over the dining halls.
- Peaked at 100 daily actives, found by standing outside the dining commons installing it on phones and taking feedback.
- A cron scrape batches menus through Claude Sonnet, 150 per call into 12 cuisines; a request is then one Firestore read.

Research

Undergraduate Researcher, Complex Care Laboratory

UC Davis Health — Advisor: Dr. Clodomir Santana

May 2025 – June 2026

Sacramento, CA

- Fine-tuned spaCy v3 NER with custom tok2vec embeddings on 4,200 clinical notes: F1 76% to 91%, now running weekly.
- Scored polarity with caseOLAP over the UMLS taxonomy: 6 cardiovascular risk factors tied to readmission ($p < 0.01$).

Education

University of California, Davis

Bachelor of Science in Computer Science & Engineering · Tau Beta Pi · Magna Cum Laude

Davis, CA

June 2026
