Experience

AI Innovation Intern

June 2026 – Present

Crescendo AI

San Francisco, CA

- Sole engineer on the internal AI platform. Five apps live on Cloud Run and Cloud SQL in six weeks.
- Model routing for triage: a rules pre-filter, then an LLM judge, then a frontier model only for drafts. A grounding gate blocks any output that cannot quote its evidence. Moving the judge to open-source models at equal quality cut cost per query 40%.
- Ran the routing study behind it: 890 tasks, 7,570 model-task cells over 10 models. The cheap tier beat the frontier tier on this workload, 0.702 against 0.637 quality at a fifteenth of the cost per task.
- Architected the sales data lake and migrated 5M records into it in a day. Gong, Salesforce, and HubSpot now feed it daily, giving sales one agent-queryable source of truth instead of six disconnected systems.
- Shipped the Cloudflare-to-GCP production migration in under a week: 12 data stores behind one compatibility interface.
- Built the competitor-intelligence tracker: 10 sources monitoring Decagon, Sierra, Parloa, and Cresta.
- Closed a \$50k/year customer, outside the role: 20 minutes with their founder, then on site to deploy. Live in a week.

Software Engineer

July 2025 – July 2026

Ovavision Fertility

New York City, NY (Remote)

- Rebuilding the consumer app end to end in React and Next.js, through UAT cycles with clinical advisors. Moved model serving async on FastAPI, Celery, and Redis over AWS ECS/Fargate, taking p95 from 850ms to 210ms.
- Replaced the mocked model path with a two-stage ONNX pipeline on a dedicated GPU host, behind a polling job protocol whose idempotency guards stop a retry overwriting a finished result.
- Built the Stripe payment layer behind 100 backend tests: PaymentIntents, webhooks, coupons, regional pricing, rollover.

Data Engineering Intern

June 2025 – Sep 2025

Rigetti Computing

Fremont, CA

- Built the fab monitoring dashboard on Palantir Foundry over sensor, cryostat, and process-control streams: 15+ KPIs, used daily.
- Anomaly detection over 60M+ daily sensor records. Partitioning and indexing took the dashboard query from 2.1s to 0.74s.

Software Engineer Intern

Jan 2025 – May 2025

European Bank for Reconstruction and Development (EBRD)

London, United Kingdom (Remote)

- A RAG system on Azure OpenAI and Cognitive Search replaced keyword search as the default research path for 50+ analysts.
- NLP pipeline (spaCy, transformers) classifying 30k–70k articles a day at 86–93% precision into an analyst risk queue.

Projects

DavisDine

April 2026

iOS in SwiftUI, FastAPI and Firestore on Google App Engine

Live on the App Store

- Built and shipped alone, zero to App Store in a week: allergen filtering and a macro planner over the dining halls.
- Peaked at 100 daily actives, found by standing outside the dining commons installing it on phones and taking feedback.
- A cron scrape batches menus through Claude Sonnet, 150 per call into 12 cuisines; a request is then one Firestore read.

Engram

May 2026

Agent memory: SQLite FTS5, BGE embeddings, cross-encoder rerank

Serving four coding agents

- 0.891 and 0.726 Recall@10 on the two LoCoMo tracks against the paper's 0.847 and 0.662; the reranker carries 14.9 of it.

Research

Undergraduate Researcher, Complex Care Laboratory

May 2025 – June 2026

UC Davis Health — Advisor: Dr. Clodomir Santana

Sacramento, CA

- Fine-tuned spaCy v3 NER with custom tok2vec embeddings on 4,200 clinical notes: F1 76% to 91%, now running weekly.

Education

University of California, Davis

Davis, CA

Bachelor of Science in Computer Science & Engineering · Tau Beta Pi · Magna Cum Laude

June 2026
