EXPERIENCE

AI Innovation Intern

Crescendo AI

May 2026 – Present

San Francisco, CA

- Sole engineer on the internal AI platform: five apps (Slack triage, executive monitor, recognition, deployment and sales friction, market digest) live on GCP Cloud Run + Cloud SQL Postgres within six weeks of joining. 20-table schema, 8 endpoints, 301 tests.
- Triage tiers a rules pre-filter into an LLM judge, escalating to a frontier model only for drafts; a grounding gate blocks any output that cannot quote its evidence. Moved the judge from closed to open-source models in the same quality range, cutting inference cost per query 40%.
- Builds by running coding agents in parallel (Claude Code, Codex, pi) over a shared persistent memory store, so each agent starts with everything the others learned. The Cloudflare-to-GCP production migration, 12 data stores ported behind a compatibility interface with keyless deploys, shipped in under a week.

Member of Technical Staff

Ovavision (AI Fertility Startup)

July 2025 – Present

New York City, NY (Remote)

- Rebuilding the consumer React/Next.js app end to end: information architecture, component system, and interaction flows, through UAT cycles with clinical advisors.
- Moved model serving async (FastAPI, Celery + Redis on AWS ECS/Fargate), taking p95 from 850ms to 210ms.

Software Engineer Intern

European Bank for Reconstruction and Development (EBRD)

Jan 2025 – May 2025

London, United Kingdom

- Shipped a RAG system on Azure OpenAI + Cognitive Search to the analyst desk, where it replaced keyword search as the default research path for 50+ analysts.
- Wrote the NLP pipeline (spaCy + transformers) classifying 30k–70k articles/day at 86–93% precision into a risk queue analysts work from directly.
- Put the models behind gated evaluation and blue-green deploys on Azure ML + AKS, taking releases from days to hours.

Data Engineering Intern

Rigetti Computing

June 2025 – Sep 2025

Fremont, CA

- Built the fab monitoring dashboard on Palantir Foundry over sensor, cryostat, and process-control streams; 15+ KPIs, used daily by the fab engineering teams.
- Wrote the anomaly detection pass over 60M+ daily sensor records, and partitioned and composite-indexed the backing store to keep the dashboard query under a second (2.1s → 0.74s).

Data Science Intern

Quantum Brains

June 2024 – Aug 2024

London, United Kingdom (Remote)

- Built hybrid retrieval (BM25 + dense embeddings, Pinecone, cross-encoder re-ranking) and served it from a FastAPI + Redis inference service, cutting query latency from minutes to seconds.

RESEARCH

Undergraduate Researcher, Complex Care Laboratory

UC Davis Health — Advisor: Dr. Clodomir Santana

May 2025 – Present

Sacramento, CA

- Fine-tuned spaCy v3 NER with custom tok2vec embeddings on 4,200 clinical notes, taking F1 from 76% to 91%. The pipeline runs weekly over incoming notes.
- Scored polarity with caseOLAP over the UMLS taxonomy via scispaCy; surfaced 6 cardiovascular risk factors associated with readmission ($p < 0.01$).
- Trained a PubMedBERT sentence classifier (focal loss, data augmentation) to separate true protein-disease associations from incidental mentions in HFPeF literature. 0.656 macro F1 ($n=176$); cut 500 false-positive proteins (14%) from CaseOLAP rankings across 25,000 abstracts.

EDUCATION

University of California, Davis

B.S. in Computer Science & Engineering GPA: 3.9 | Tau Beta Pi

Davis, CA

June 2026
